

Pearls in management of Allergic Fungal Rhinosinusitis

Binsa Basheer

SK Hospital, Thiruvananthapuram, India.

Abstract

Rhinoplasty AFRS is a disease with a varied presentation. It takes an alert clinician to identify the disease and subsequently manage the condition. Although surgical debridement remains the mainstay of treatment protocol it doesnot always lead to a long term disease free state. A fascinating disease, AFRS is mostly recalcitrant to surgery alone and requires long term follow up with early detection of tecurrence or flare ups. Here we will be comparing patients with early disease involvement and patients with multiple recurrence and their subsequent management. We shall glaze upon the diagnostic criteria of AFRS , review the tips and tricks in surgery and consider various aspects of post-operative management.
